## Body (*already mostly filled, just slight tweak below*)

### **New Delhi, May 6, 2025**

The Indian government has announced a significant increase in import tariffs on a range of electronic goods, including smartphones, laptops, and LED TVs. The revised tariff, effective from May 10, 2025, is expected to impact major global electronics brands exporting to India.

According to the Ministry of Finance, the move is aimed at promoting domestic manufacturing under the 'Make in India' initiative. Industry experts warn that the hike may lead to increased consumer prices and disruptions in the short term.

Market analysts are closely watching how global manufacturers like Samsung and Apple will respond to the new duties.

---

## Summary (*already good*)

Same as above, or shorten to 2–3 lines:

India has announced a significant import tariff hike on smartphones, laptops, and LED TVs. The change, effective May 10, 2025, aims to boost local manufacturing but may raise consumer costs.

---

## Why this matters

This move reflects India's continued push toward self-reliance in electronics manufacturing. The higher duties may shift sourcing strategies for major global brands and could lead to

downstream price increases for Indian consumers. Trade partners will also assess the impact on bilateral trade flows.
